

Sierra Mac Client 5.2.2.1

Tech Bulletin - August 2014

Mac Client 5.2.2.1 has been released to overcome Sierra connection issues seen when the Client platform has more than one network interface.

It is possible that when the Mac has more than one NIC, the Server will fail to fully establish communication with the Client resulting in the error: "Server cannot connect to client, please check firewall settings".

This version of the Mac Client is fully compatible with Sierra V5.2.2

For new installations, this version should be used in preference to the V5.2.2.0 Client in cases where the Mac has multiple NICs. (If existing installations are not exhibiting issues then there is no requirement to update the Client).
